## **Purpose**

In an online application, a web audit is performed to examine vulnerabilities that might lead to security breaches and to find discrepancies that might lead to Google penalties.

The Cyber Security Batch students were assigned the task of doing a web application vulnerability assessment, which would be valuable to them. To begin with the task, the students were instructed to consult the Bug Bounty Communities as a form of selection for the online application.

We were advised to use Automated as well as manual testing for this security web audit. To check for vulnerabilities, utilize the following tools. using the automated method. dotdotpwn , uniscan ,nikto ,sublist3r ,D-TECT, wafw00f and Nessus, Nmap and Owasp zap.

## **Abstract**

Cybercrime, distortion and breakdown of information provide threat to organizations that are very harmful. A ton has been lost, and companies need to find mechanisms to prevent the hazards from truly arising. This examination examined online security IT audit solutions and how web audits might improve IT security for enterprises. The examination estimated IT administrators and workers' attention to cybercrime hazards; estimated their knowledge of IT security audit norms and rules; and estimated the effect of IT security audit on association's development. The study used an organization as context analysis, evaluates the company's IT security flow audit state and decides if the IT safety audit strategy and system can be adapted for development. A quantitative examination was conducted to collect information on cybercrime and to collect detailed information on this subject. This research has unequivocally shown that IT security audits are essential to improving any IT association.

## **SCOPE**

As a music lover, I proceeded to select my preferred online program for streaming music, SPOTIFY.

The Link for choosing this domain will be listed below. This is a very versatile web application which requires standard authentication of the Username and the Password.

**Domain of Assessment :** <https://hackerone.com/spotify?type=team>

## **Target validation**

The term "target validation" refers to ensuring that the target we're auditing is in scope and that it's the one we picked. This goal may be achieved utilizing a variety of tools, including nslookup, dnsrecon and WHOIS.

The tool "WHOIS" is a query and response protocol that is used to query databases that maintain information about an Internet resource's registered users. It may be used for a variety of things, such as a domain name, an IP address block, or an autonomous system, but it may also be used for a lot more.

## **Finding subdomains**

Subdomains may have "exploits or vulnerabilities" that allow hackers to get access to the whole website. We, on the other hand, have no knowledge what type of vulnerabilities exist in the subdomains, because they do not give publicity about them.

Subdomains are frequently undeveloped and contain experimental functionality, such as beta.Spotify.com. As a result, there's a good probability they'll include exploits.

The following are some of the most often used tools for locating subdomains.:

- Sublist3r
- crt.sh
- Nmaps (active scanning)

For this project, I have all three of them.

## Crt.sh

crt.sh is web interface. that lets you search for certs that have been logged by CT. <https://crt.sh>. Pronounced "search".

Certificates	crt.sh ID	Logged At	Not Before	Not After	Common Name	Matching Identities	Issuer Name

## Sublist3r

Sublister is a python-based application that leverages OSINT to enumerate subdomains of websites. It assists pen-testers in collecting and accumulating subdomains for a target domain.

Sublilster use a variety of search engines, such as Google, Yahoo, and others, as well as programs such as Netcraft, Virustotal, Threatcrowd, DNSdumpster, ReverseDNS and others, to obtain reliable results.

## Installation:

1. To install sublister you can clone the Github repository and use it. To do so you can follow the command

```
git clone https://github.com/aboul3la/Sublist3r.git
```

```
[ihameths-MacBook-Pro:~ ihamethsanjukta]$ cd Documents/
[ihameths-MacBook-Pro:Documents ihamethsanjukta]$ git clone https://github.com/aboul3la/Sublist3r.git
Cloning into 'Sublist3r'...
remote: Enumerating objects: 383, done.
remote: Total 383 (delta 0), reused 0 (delta 0), pack-reused 383
Receiving objects: 100% (383/383) 1.12 MB | 1.12 MB/s, done.
Resolving deltas: 100% (233/233), done.
[ihameths-MacBook-Pro:Documents ihamethsanjukta]
```

2. Once the process is done move to the sublister directory  
cd sublist3r

```
[ihameths-MacBook-Pro:Documents ihamethsanjukta]$ cd Sublist3r/
[ihameths-MacBook-Pro:Sublist3r ihamethsanjukta]$ pip install -r requirements.txt

## Fingerprinting

The goal of fingerprinting, also known as foot printing, is to gather as much information about a particular online application as possible. It is a collection of data that may be used to identify network protocols, operating systems, hardware, and software, among other things.

This method is used to authenticate users as a security precaution, however attackers might use it to find weaknesses in the target web application. This contains details such as operating system kinds and versions, domain names, network blocks, VPN points, and so on.

A bespoke packet set is launched to acquire information, and when they obtain a response from the target, information about operating systems, protocols, and other topics is withdrawn.

Passive and active fingerprinting are the two major methods of fingerprinting. Sending packets to the target and waiting for a response, then evaluating the result, is what active fingerprinting entails. Passive fingerprinting entails observing the target's network activity without intervening directly.

Tools that could be used to do fingerprinting are;

- Ettercap
- PacketFence
- Netcat
- Nmap
- Nessus
- Nikto

## Nikto

Nikto is an Open Source (GPL) web server scanner that scans web servers for a variety of issues, including over 6700 potentially harmful files/programs, outdated versions on over 1250 sites, and version-specific issues on over 270 servers. It also looks for server configuration elements like numerous index files and HTTP server settings, as well as web servers and applications that have been installed. Scan items and plugins are updated on a regular basis and can be updated automatically.

Nikto isn't intended to be a sneaky tool. It will test a web server as quickly as possible, and the results will be visible in log files or to an IPS/IDS. However, LibWhisker's anti-IDS techniques are supported if you wish to try them out (or test your IDS system).

Although most checks constitute a security risk, not all of them are. Some items are “info only” type tests that look for things that may or may not have a security problem, but that the webmaster or security engineer may not be aware of. In most cases, these things are labeled adequately in the written content. There are also some checks for unknown objects that have been spotted in log files being examined for.

Usage:

```
nikto -h https://www.spotify.com -o ~/Documents/Pentest/Spotify/nikto/www.spotify.com.txt
```

```

MacBook-Pro:~ ProSublist3r$ nikto -h https://www.spotify.com

## NMAP

Nmap (Network Mapper) is a free and open-source vulnerability scanner and network discovery tool. Nmap is a network administrator's tool for determining what devices are operating on their systems, locating available hosts and the services they provide, identifying open ports, and identifying security threats.

Nmap may be used to monitor individual hosts as well as large networks with hundreds of thousands of devices and subnets. Nmap is a port-scan tool that gathers information by sending raw packets to system ports. It has grown over time and is incredibly adaptable, but at its core, it is a port-scan tool. It monitors replies to see if ports are open, closed, or filtered in some way by a firewall, for example. Port scanning is often referred to as port discovery or

## Usage

```
sudo nmap -T4 -R -P 443 -o
/Users/thenethsanjuka/Documents/Pentest/Spotify/Nmap/test.www.spotify.com_nm
ap.txt 35.186.224.25
```

The screenshot shows a terminal window titled "thenethsanjuka — bash — 80x50". The command entered was "sudo nmap -T4 -R -P 443 -o /Users/thenethsanjuka/Documents/Pentest/Spotify/Nmap/test.www.spotify.com\_nm ap.txt 35.186.224.25". The output shows the following information:

```
[Theneths-MacBook-Pro:~ thenethsanjuka$ sudo nmap -T4 -R -P 443 -o /Users/thenethsanjuka/Documents/Pentest/Spotify/Nmap/test.www.spotify.com_nm ap.txt 35.186.224.25

## Nessus

Nessus is a remote security scanning program that examines a computer and alerts you if it finds any vulnerabilities that malevolent hackers may exploit to obtain access to any machine on your network. It accomplishes this by doing over 1200 tests on a specific machine, determining if any of these assaults might be used to break into or harm the machine.

The majority of high-level network traffic, such as email and web pages, is routed through a high-level protocol that is safely sent via a TCP stream. A computer separates its physical connection to the network into thousands of logical pathways, known as ports, to prevent various streams from interfering with one other. So, if you wanted to communicate to a web server on a particular system, you'd connect to port #80 (the standard HTTP port), but if you wanted to communicate to an SMTP server on the same computer, you'd connect to port #81 (the standard SMTP port).

Every computer contains thousands of ports, some of which may or may not be used by services (for example, a server for a certain high-level protocol). Nessus works by analyzing each port on a computer, determining what service it is running, and then testing that service for vulnerabilities that may be exploited by a hacker to launch a hostile attack. Nessus is known as a "remote scanner" since it does not require installation on a computer to test it. Instead, you may install it on a single computer and test it on as many as you like.

## Interface:

The screenshot shows the Nessus web interface with the URL <https://localhost:8834/#/scans/folders/my-scans>. The left sidebar includes sections for FOLDERS (My Scans, All Scans, Trash), RESOURCES (Policies, Plugin Rules), and TEAMVIEW (Community, Research, Plugin Release Notes). The main content area is titled 'My Scans' and displays a table with three rows:

Name	Schedule	Last Modified
accounts.spotify.com	On Demand	✓ June 1 at 1:00 PM
beta.spotify.com	On Demand	✓ June 1 at 12:00 PM
everynoise.com	On Demand	✓ June 1 at 8:42 AM

A 'Tenable News' sidebar on the left lists 'NPE Exploit', 'Infrastructure Manager v1.21', and 'Authenti...', with a 'Read More' link.

Output:

**Skip output from Nessus**

## Vulnerabilities by Host

---

## 35.186.224.25

### Scan Information

Start time: Tue Jun 1 10:39:55 2021  
End time: Tue Jun 1 12:00:11 2021

### Host Information

DNS Name: 25.224.186.35.bc.googleusercontent.com  
IP: 35.186.224.25  
OS: Microsoft Windows Server 2012 R2

### Vulnerabilities

#### 42873 - SSL Medium Strength Cipher Suites Supported (SWEET32)

---

### Synopsis

The remote service supports the use of medium strength SSL ciphers.

### Description

The remote host supports the use of SSL ciphers that offer medium strength encryption. Nessus regards medium strength as any encryption that uses key lengths at least 64 bits and less than 112 bits, or else that uses the 3DES encryption suite.

Note that it is considerably easier to circumvent medium strength encryption if the attacker is on the same physical network.

### See Also

---

<https://www.openssl.org/blog/blog/2016/08/24/sweet32/>

<https://sweet32.info>

---

### Solution

Reconfigure the affected application if possible to avoid use of medium strength ciphers.

---

### Risk Factor

Medium

#### CVSS v3.0 Base Score

7.5 (CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:N/A:N)

#### CVSS v2.0 Base Score

5.0 (CVSS2#AV:N/AC:L/Au:N/C:P/I:N/A:N)

#### References

CVE CVE-2016-2183

#### Plugin Information

Published: 2009/11/23, Modified: 2021/02/03

#### Plugin Output

tcp/443/http\_proxy

Medium Strength Ciphers (> 64-bit and < 112-bit key, or 3DES)

Name	Code	KEX	Auth	Encryption	MAC
DES-CBC3-SHA	0x00, 0x0A	---	---	3DES-CBC(168)	---
SHA1		RSA	RSA		

The fields above are :

{Tenable ciphername}  
{Cipher ID code}  
Kex={key exchange}  
Auth={authentication}  
Encrypt={symmetric encryption method}  
MAC={message authentication code}  
{export flag}

## 104743 - TLS Version 1.0 Protocol Detection

### Synopsis

The remote service encrypts traffic using an older version of TLS.

### Description

The remote service accepts connections encrypted using TLS 1.0. TLS 1.0 has a number of cryptographic design flaws. Modern implementations of TLS 1.0 mitigate these problems, but newer versions of TLS like 1.2 and 1.3 are designed against these flaws and should be used whenever possible.

As of March 31, 2020, Endpoints that aren't enabled for TLS 1.2 and higher will no longer function properly with major web browsers and major vendors.

PCI DSS v3.2 requires that TLS 1.0 be disabled entirely by June 30, 2018, except for POS POI terminals (and the SSL/TLS termination points to which they connect) that can be verified as not being susceptible to any known exploits.

### See Also

<https://tools.ietf.org/html/draft-ietf-tls-oldversions-deprecate-00>

### Solution

Enable support for TLS 1.2 and 1.3, and disable support for TLS 1.0.

### Risk Factor

Medium

### CVSS v3.0 Base Score

6.5 (CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:H/I:L/A:N)

### CVSS v2.0 Base Score

6.1 (CVSS2#AV:N/AC:H/Au:N/C:C/I:P/A:N)

### Plugin Information

Published: 2017/11/22, Modified: 2020/03/31

### Plugin Output

tcp/443/http\_proxy

TLSv1 is enabled and the server supports at least one cipher.

## 46180 - Additional DNS Hostnames

### Synopsis

Nessus has detected potential virtual hosts.

### Description

Hostnames different from the current hostname have been collected by miscellaneous plugins. Nessus has generated a list of hostnames that point to the remote host. Note that these are only the alternate hostnames for vhosts discovered on a web server.

Different web servers may be hosted on name-based virtual hosts.

### See Also

[https://en.wikipedia.org/wiki/Virtual\\_hosting](https://en.wikipedia.org/wiki/Virtual_hosting)

### Solution

If you want to test them, re-scan using the special vhost syntax, such as :

www.example.com[192.0.32.10]

### Risk Factor

None

### Plugin Information

Published: 2010/04/29, Modified: 2020/06/12

### Plugin Output

tcp/0

The following hostnames point to the remote host :  
- wg.spotify.com

## 45590 - Common Platform Enumeration (CPE)

### Synopsis

It was possible to enumerate CPE names that matched on the remote system.

### Description

By using information obtained from a Nessus scan, this plugin reports CPE (Common Platform Enumeration) matches for various hardware and software products found on a host.

Note that if an official CPE is not available for the product, this plugin computes the best possible CPE based on the information available from the scan.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2010/04/21, Modified: 2021/05/24

### Plugin Output

tcp/0

The remote operating system matched the following CPE :

cpe:/o:microsoft:windows\_server\_2012:r2

## 54615 - Device Type

### Synopsis

It is possible to guess the remote device type.

### Description

Based on the remote operating system, it is possible to determine what the remote system type is (eg: a printer, router, general-purpose computer, etc).

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2011/05/23, Modified: 2011/05/23

### Plugin Output

tcp/0

Remote device type : unknown  
Confidence level : 56

## 84502 - HSTS Missing From HTTPS Server

### Synopsis

The remote web server is not enforcing HSTS.

### Description

The remote HTTPS server is not enforcing HTTP Strict Transport Security (HSTS). HSTS is an optional response header that can be configured on the server to instruct the browser to only communicate via HTTPS. The lack of HSTS allows downgrade attacks, SSL-stripping man-in-the-middle attacks, and weakens cookie-hijacking protections.

### See Also

<https://tools.ietf.org/html/rfc6797>

### Solution

Configure the remote web server to use HSTS.

### Risk Factor

None

### Plugin Information

Published: 2015/07/02, Modified: 2021/05/19

### Plugin Output

tcp/443/http\_proxy

The remote HTTPS server does not send the HTTP "Strict-Transport-Security" header.

## 10107 - HTTP Server Type and Version

### Synopsis

A web server is running on the remote host.

### Description

This plugin attempts to determine the type and the version of the remote web server.

### Solution

n/a

### Risk Factor

None

### References

XREF IAVT:0001-T-0931

### Plugin Information

Published: 2000/01/04, Modified: 2020/10/30

### Plugin Output

tcp/80/http\_proxy

The remote web server type is :

envoy

## 10107 - HTTP Server Type and Version

### Synopsis

A web server is running on the remote host.

### Description

This plugin attempts to determine the type and the version of the remote web server.

The remote web server type is :

envoy

## 12053 - Host Fully Qualified Domain Name (FQDN) Resolution

### Synopsis

It was possible to resolve the name of the remote host.

### Description

Nessus was able to resolve the fully qualified domain name (FQDN) of the remote host.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2004/02/11, Modified: 2017/04/14

### Plugin Output

tcp/0

35.186.224.25 resolves as 25.224.186.35.bc.googleusercontent.com.

## 24260 - HyperText Transfer Protocol (HTTP) Information

### Synopsis

Some information about the remote HTTP configuration can be extracted.

### Description

This test gives some information about the remote HTTP protocol - the version used, whether HTTP Keep-Alive and HTTP pipelining are enabled, etc...

This test is informational only and does not denote any security problem.

### Solution

## 11219 - Nessus SYN scanner

### Synopsis

It is possible to determine which TCP ports are open.

### Description

This plugin is a SYN 'half-open' port scanner. It shall be reasonably quick even against a firewalled target.

Note that SYN scans are less intrusive than TCP (full connect) scans against broken services, but they might cause problems for less robust firewalls and also leave unclosed connections on the remote target, if the network is loaded.

### Solution

Protect your target with an IP filter.

### Risk Factor

None

### Plugin Information

Published: 2009/02/04, Modified: 2021/04/20

### Plugin Output

tcp/25

Port 25/tcp was found to be open

## 11219 - Nessus SYN scanner

### Plugin Output

tcp/465

Port 465/tcp was found to be open

## 11219 - Nessus SYN scanner

### Synopsis

It is possible to determine which TCP ports are open.

### Description

This plugin is a SYN 'half-open' port scanner. It shall be reasonably quick even against a firewalled target.

Note that SYN scans are less intrusive than TCP (full connect) scans against broken services, but they might cause problems for less robust firewalls and also leave unclosed connections on the remote target, if the network is loaded.

### Solution

Protect your target with an IP filter.

### Risk Factor

None

### Plugin Information

Published: 2009/02/04, Modified: 2021/04/20

### Plugin Output

tcp/587

Port 587/tcp was found to be open

## 19506 - Nessus Scan Information

### Synopsis

This plugin displays information about the Nessus scan.

### Description

This plugin displays, for each tested host, information about the scan itself :

- + The version of the plugin set.
- + The type of scanner (Nessus or Nessus Home).
- + The version of the Nessus Engine.
- + The port scanner(s) used.
- + The port range scanned.
- + The ping round trip time
- + Whether credentialed or third-party patch management checks are possible.
- + Whether the display of superseded patches is enabled
- + The date of the scan.
- + The duration of the scan.
- + The number of hosts scanned in parallel.
- + The number of checks done in parallel.

### Solution

### Plugin Output

tcp/0

Information about this scan :

Nessus version : 8.14.0  
Plugin feed version : 202105311915  
Scanner edition used : Nessus Home  
Scan type : Normal  
Scan policy used : Basic Network Scan  
Scanner IP : 192.168.1.101  
Port scanner(s) : nessus\_syn\_scanner  
Port range : default

```
Ping RTT : 179.414 ms
Thorough tests : no
Experimental tests : no
Paranoia level : 1
Report verbosity : 1
Safe checks : yes
Optimize the test : yes
Credentialed checks : no
Patch management checks : None
Display superseded patches : yes (supersedence plugin launched)
CGI scanning : disabled
Web application tests : disabled
Max hosts : 30
Max checks : 4
Recv timeout : 5
Backports : None
Allow post-scan editing: Yes
Scan Start Date : 2021/6/1 10:40 +0530
Scan duration : 4790 sec
```

## 11936 - OS Identification

### Synopsis

It is possible to guess the remote operating system.

### Description

Using a combination of remote probes (e.g., TCP/IP, SMB, HTTP, NTP, SNMP, etc.), it is possible to guess the name of the remote operating system in use. It is also possible sometimes to guess the version of the operating system.

### Solution

n/a

### Risk Factor

```
Remote operating system : Microsoft Windows Server 2012 R2
Confidence level : 56
Method : MLSinFP
```

```
The remote host is running Microsoft Windows Server 2012 R2
```

## 10919 - Open Port Re-check

### Synopsis

Previously open ports are now closed.

### Description

One of several ports that were previously open are now closed or unresponsive.

There are several possible reasons for this :

- The scan may have caused a service to freeze or stop running.
- An administrator may have stopped a particular service during the scanning process. This might be an availability problem related to the following :
  - A network outage has been experienced during the scan, and the remote network cannot be reached anymore by the scanner.
  - This scanner may have been blacklisted by the system administrator or by an automatic intrusion detection / prevention system that detected the scan.
  - The remote host is now down, either because a user turned it off during the scan or because a select denial of service was effective.

In any case, the audit of the remote host might be incomplete and may need to be done again.

### Solution

- Increase checks\_read\_timeout and/or reduce max\_checks.
- Disable any IPS during the Nessus scan

### Risk Factor

None

Port 25 was detected as being open but is now unresponsive

## 50845 - OpenSSL Detection

### Synopsis

The remote service appears to use OpenSSL to encrypt traffic.

### Description

Based on its response to a TLS request with a specially crafted server name extension, it seems that the remote service is using the OpenSSL library to encrypt traffic.

Note that this plugin can only detect OpenSSL implementations that have enabled support for TLS extensions (RFC 4366).

### Plugin Output

tcp/443/http\_proxy

### Synopsis

The remote IP address seems to connect to different hosts via reverse NAT, or an intercepting proxy is in the way.

### Description

Reverse NAT is a technology which lets multiple computers offer public services on different ports via the same IP address.

Based on OS fingerprinting results, it seems that different operating systems are listening on different remote ports.

Note that this behavior may also indicate the presence of a intercepting proxy, a load balancer or a traffic shaper.

## 70544 - SSL Cipher Block Chaining Cipher Suites Supported

### Synopsis

The remote service supports the use of SSL Cipher Block Chaining ciphers, which combine previous blocks with subsequent ones.

### Description

The remote host supports the use of SSL ciphers that operate in Cipher Block Chaining (CBC) mode. These cipher suites offer additional security over Electronic Codebook (ECB) mode, but have the potential to leak information if used improperly.

### See Also

### Plugin Output

tcp/443/http\_proxy

Here is the list of SSL CBC ciphers supported by the remote server :

Medium Strength Ciphers (> 64-bit and < 112-bit key, or 3DES)

Name	Code	KEX	Auth	Encryption	MA C
DES-CBC3-SHA	0x00, 0x0A	---	RSA	3DES-CBC(168)	---
SHA1					

High Strength Ciphers (>= 112-bit key)

Name	Code	KEX	Auth	Encryption	MA C
ECDHE-RSA-AES128-SHA	0xC0, 0x13	ECDH	RSA	AES-CBC(128)	---
SHA1					
ECDHE-RSA-AES256-SHA	0xC0, 0x14	ECDH	RSA	AES-CBC(256)	---
SHA1					

AES128-SHA	0x00,	0x2F	RSA	RSA	AES-CBC(128)
SHA1					
AES256-SHA	0x00,	0x35	RSA	RSA	AES-CBC(256)
SHA1					

The fields above are :

{Tenable ciphername}  
 {Cipher ID code}  
 Kex={key exchange}  
 Auth={authentication}  
 Encrypt={symmetric encryption method}  
 MAC={message authentication code}  
 {export flag}

## 21643 - SSL Cipher Suites Supported

### Synopsis

The remote service encrypts communications using SSL.

### Description

This plugin detects which SSL ciphers are supported by the remote service for encrypting communications.

### See Also

AES128 [...]					

## 57041 - SSL Perfect Forward Secrecy Cipher Suites Supported

### Synopsis

The remote service supports the use of SSL Perfect Forward Secrecy ciphers, which maintain confidentiality even if the key is stolen.

### Description

The remote host supports the use of SSL ciphers that offer Perfect Forward Secrecy (PFS) encryption. These cipher suites ensure that recorded SSL traffic cannot be broken at a future date if the server's private key is compromised.

## 94761 - SSL Root Certification Authority Certificate Information

### Synopsis

A root Certification Authority certificate was found at the top of the certificate chain.

### Description

The remote service uses an SSL certificate chain that contains a self-signed root Certification Authority certificate at the top of the chain.

### See Also

[https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2003/cc778623\(v=ws.10\)](https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2003/cc778623(v=ws.10))

### Solution

Ensure that use of this root Certification Authority certificate complies with your organization's acceptable use and security policies.

### Risk Factor

None

### Plugin Information

Published: 2016/11/14, Modified: 2018/11/15

### Plugin Output

tcp/443/http\_proxy

The following root Certification Authority certificate was found :

-Subject	:	C=US/O=DigiCert Inc/OU=www.digicert.com/CN=DigiCert Global Root CA
-Issuer	:	C=US/O=DigiCert Inc/OU=www.digicert.com/CN=DigiCert Global Root CA
-Valid From	:	Nov 10 00:00:00 2006 GMT
-Valid To	:	Nov 10 00:00:00 2031 GMT
-Signature Algorithm :		SHA-1 With RSA Encryption

## 22964 - Service Detection

### Synopsis

The remote service could be identified.

### Description

Nessus was able to identify the remote service by its banner or by looking at the error message it sends when it receives an HTTP request.

### Solution

tcp/20000

The service closed the connection without sending any data.  
It might be protected by some sort of TCP wrapper.

## 25220 - TCP/IP Timestamps Supported

### Synopsis

The remote service implements TCP timestamps.

### Description

The remote host implements TCP timestamps, as defined by RFC1323. A side effect of this feature is that the uptime of the remote host can sometimes be computed.

### See Also

<http://www.ietf.org/rfc/rfc1323.txt>

tcp/0

## 84821 - TLS ALPN Supported Protocol Enumeration

### Synopsis

The remote host supports the TLS ALPN extension.

### Description

The remote host supports the TLS ALPN extension. This plugin enumerates the protocols the extension supports.

### See Also

<https://tools.ietf.org/html/rfc7301>

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2015/07/17, Modified: 2021/02/03

### Plugin Output

tcp/443/http\_proxy

```
http/1.1
h2
```

## 87242 - TLS NPN Supported Protocol Enumeration

### Synopsis

The remote host supports the TLS NPN extension.

### Description

The remote host supports the TLS NPN (Transport Layer Security Next Protocol Negotiation) extension. This plugin enumerates the protocols the extension supports.

### See Also

<https://tools.ietf.org/id/draft-agl-tls-nextprotoneg-03.html>

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2015/12/08, Modified: 2021/02/03

### Plugin Output

tcp/443/http\_proxy

NPN Supported Protocols:

grpc-exp  
h2  
http/1.1

## 62564 - TLS Next Protocols Supported

### Synopsis

The remote service advertises one or more protocols as being supported over TLS.

### Description

This script detects which protocols are advertised by the remote service to be encapsulated by TLS connections.

Note that Nessus did not attempt to negotiate TLS sessions with the protocols shown. The remote service may be falsely advertising these protocols and / or failing to advertise other supported protocols.

### See Also

<https://tools.ietf.org/html/draft-agl-tls-nextprotoneg-04>

<https://technotes.googlecode.com/git/nextprotoneg.html>

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2012/10/16, Modified: 2021/02/03

### Plugin Output

tcp/443/http\_proxy

The target advertises that the following protocols are supported over SSL / TLS:

```
grpc-exp
h2
http/1.1
```

## 121010 - TLS Version 1.1 Protocol Detection

### Synopsis

The remote service encrypts traffic using an older version of TLS.

### Description

The remote service accepts connections encrypted using TLS 1.1.

TLS 1.1 lacks support for current and recommended cipher suites.

Ciphers that support encryption before MAC computation, and authenticated encryption modes such as GCM cannot be used with TLS 1.1

As of March 31, 2020, Endpoints that are not enabled for TLS 1.2 and higher will no longer function properly with major web browsers and major vendors.

### See Also

<https://tools.ietf.org/html/draft-ietf-tls-oldversions-deprecate-00>

<http://www.nessus.org/u?c8ae820d>

### Solution

Enable support for TLS 1.2 and/or 1.3, and disable support for TLS 1.1.

### Risk Factor

None

### Plugin Information

Published: 2019/01/08, Modified: 2020/08/07

### Plugin Output

tcp/443/http\_proxy

TLSv1.1 is enabled and the server supports at least one cipher.

## 136318 - TLS Version 1.2 Protocol Detection

### Synopsis

The remote service encrypts traffic using a version of TLS.

### Description

The remote service accepts connections encrypted using TLS 1.2.

### See Also

<https://tools.ietf.org/html/rfc5246>

### Solution

N/A

### Risk Factor

None

### Plugin Information

Published: 2020/05/04, Modified: 2020/05/04

### Plugin Output

tcp/443/http\_proxy

TLSv1.2 is enabled and the server supports at least one cipher.

## 138330 - TLS Version 1.3 Protocol Detection

### Synopsis

The remote service encrypts traffic using a version of TLS.

### Description

The remote service accepts connections encrypted using TLS 1.3.

### See Also

<https://tools.ietf.org/html/rfc8446>

### Solution

N/A

### Risk Factor

None

### Plugin Information

Published: 2020/07/09, Modified: 2020/07/09

### Plugin Output

tcp/443/http\_proxy

TLSv1.3 is enabled and the server supports at least one cipher.

## 10287 - Traceroute Information

### Synopsis

It was possible to obtain traceroute information.

### Description

Makes a traceroute to the remote host.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 1999/11/27, Modified: 2020/08/20

### Plugin Output

udp/0

For your information, here is the traceroute from 192.168.1.101 to 35.186.224.25 :

192.168.1.101  
192.168.1.1  
172.20.13.2  
222.165.184.249  
222.165.175.134  
222.165.175.129  
103.87.125.129  
103.87.124.133  
103.87.124.206  
74.125.48.62  
209.85.243.57  
209.85.244.157  
35.186.224.25

Hop Count: 12

## 10386 - Web Server No 404 Error Code Check

### Synopsis

The remote web server does not return 404 error codes.

### Description

The remote web server is configured such that it does not return '404 Not Found' error codes when a nonexistent file is requested, perhaps returning instead a site map, search page or authentication page.

Nessus has enabled some counter measures for this. However, they might be insufficient. If a great number of security holes are produced for this port, they might not all be accurate.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2000/04/28, Modified: 2020/06/12

### Plugin Output

tcp/80/http\_proxy

CGI scanning will be disabled for this host because the host responds to requests for non-existent URLs with HTTP code 301 rather than 404. The requested URL was :

<http://25.224.186.35.bc.googleusercontent.com/uQ3oFTVLBWYi.html>

## 95631 - SSL Certificate Signed Using Weak Hashing Algorithm (Known CA)

### Synopsis

A known CA SSL certificate in the certificate chain has been signed using a weak hashing algorithm.

### Description

The remote service uses a known CA certificate in the SSL certificate chain that has been signed using a cryptographically weak hashing algorithm (e.g., MD2, MD4, MD5, or SHA1). These signature algorithms are known to be vulnerable to collision attacks. An attacker can exploit this to generate another certificate with the same digital signature, allowing the attacker to masquerade as the affected service.

Note that this plugin reports all SSL certificate chains signed with SHA-1 that expire after January 1, 2017 as vulnerable. This is in accordance with Google's gradual sunsetting of the SHA-1 cryptographic hash algorithm.

### See Also

<https://tools.ietf.org/html/rfc3279>

<https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2008/961509>

### Solution

Contact the Certificate Authority to have the certificate reissued.

### Risk Factor

None

### References

BID	11849

## Vulnerabilities by Host

---

## 34.105.209.55

### Scan Information

Start time: Tue Jun 1 07:20:07 2021  
End time: Tue Jun 1 08:42:39 2021

### Host Information

DNS Name: 55.209.105.34.bc.googleusercontent.com  
IP: 34.105.209.55  
OS: Linux Kernel 2.6

### Vulnerabilities

#### 46180 - Additional DNS Hostnames

### Synopsis

Nessus has detected potential virtual hosts.

### Description

Hostnames different from the current hostname have been collected by miscellaneous plugins. Nessus has generated a list of hostnames that point to the remote host. Note that these are only the alternate hostnames for vhosts discovered on a web server.

Different web servers may be hosted on name-based virtual hosts.

### See Also

[https://en.wikipedia.org/wiki/Virtual\\_hosting](https://en.wikipedia.org/wiki/Virtual_hosting)

### Solution

If you want to test them, re-scan using the special vhost syntax, such as :

www.example.com[192.0.32.10]

### Risk Factor

None

## Plugin Information

---

Published: 2010/04/29, Modified: 2020/06/12

## Plugin Output

---

tcp/0

The following hostnames point to the remote host :

- everynoise.com

## 48204 - Apache HTTP Server Version

### Synopsis

It is possible to obtain the version number of the remote Apache HTTP server.

### Description

The remote host is running the Apache HTTP Server, an open source web server. It was possible to read the version number from the banner.

### See Also

<https://httpd.apache.org/>

### Solution

n/a

### Risk Factor

None

### References

### Plugin Output

tcp/80/www

```
URL      : http://55.209.105.34.bc.googleusercontent.com/
Version   : 2.4.99
backported : 1
os        : ConvertedDebian
```

## 39520 - Backported Security Patch Detection (SSH)

### Synopsis

Security patches are backported.

### Description

Security patches may have been 'backported' to the remote SSH server without changing its version number.

Banner-based checks have been disabled to avoid false positives.

Note that this test is informational only and does not denote any security problem.

### See Also

[https://access.redhat.com/security/updates/backporting/?sc\\_cid=3093](https://access.redhat.com/security/updates/backporting/?sc_cid=3093)

### Solution

### Risk Factor

None

### Plugin Information

Published: 2009/06/25, Modified: 2015/07/07

### Plugin Output

tcp/22/ssh

Give Nessus credentials to perform local checks.

## 39521 - Backported Security Patch Detection (WWW)

### Synopsis

Security patches are backported.

### Description

Security patches may have been 'backported' to the remote HTTP server without changing its version number.

Banner-based checks have been disabled to avoid false positives.

Note that this test is informational only and does not denote any security problem.

### See Also

[https://access.redhat.com/security/updates/backporting/?sc\\_cid=3093](https://access.redhat.com/security/updates/backporting/?sc_cid=3093)

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2009/06/25, Modified: 2015/07/07

### Plugin Output

tcp/80/www

Give Nessus credentials to perform local checks.

## 45590 - Common Platform Enumeration (CPE)

### Synopsis

It was possible to enumerate CPE names that matched on the remote system.

### Description

By using information obtained from a Nessus scan, this plugin reports CPE (Common Platform Enumeration) matches for various hardware and software products found on a host.

Note that if an official CPE is not available for the product, this plugin computes the best possible CPE based on the information available from the scan.

### See Also

<http://cpe.mitre.org/>

<https://nvd.nist.gov/products/cpe>

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2010/04/21, Modified: 2021/05/24

### Plugin Output

tcp/0

The remote operating system matched the following CPE :

cpe:/o:linux:linux\_kernel:2.6

Following application CPE's matched on the remote system :

cpe:/a:apache:http\_server:2.4.25 -> Apache Software Foundation Apache HTTP Server 2.4.25  
cpe:/a:apache:http\_server:2.4.99  
cpe:/a:openbsd:openssh:7.4 -> OpenBSD OpenSSH 7.4

## 54615 - Device Type

### Synopsis

It is possible to guess the remote device type.

### Description

Based on the remote operating system, it is possible to determine what the remote system type is (eg: a printer, router, general-purpose computer, etc).

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2011/05/23, Modified: 2011/05/23

### Plugin Output

tcp/0

Remote device type : general-purpose  
Confidence level : 65

## 43111 - HTTP Methods Allowed (per directory)

### Synopsis

This plugin determines which HTTP methods are allowed on various CGI directories.

### Description

By calling the OPTIONS method, it is possible to determine which HTTP methods are allowed on each directory.

The following HTTP methods are considered insecure:

PUT, DELETE, CONNECT, TRACE, HEAD

Many frameworks and languages treat 'HEAD' as a 'GET' request, albeit one without any body in the response. If a security constraint was set on 'GET' requests such that only 'authenticatedUsers' could access GET requests for a particular servlet or resource, it would be bypassed for the 'HEAD' version. This allowed unauthorized blind submission of any privileged GET request.

As this list may be incomplete, the plugin also tests - if 'Thorough tests' are enabled or 'Enable web applications tests' is set to 'yes'

in the scan policy - various known HTTP methods on each directory and considers them as unsupported if it receives a response code of 400, 403, 405, or 501.

Note that the plugin output is only informational and does not necessarily indicate the presence of any security vulnerabilities.

### Plugin Information

Published: 2000/01/04, Modified: 2020/10/30

### Plugin Output

tcp/80/www

The remote web server type is :

Apache/2.4.25 (Debian)

## 12053 - Host Fully Qualified Domain Name (FQDN) Resolution

### Synopsis

It was possible to resolve the name of the remote host.

### Description

Nessus was able to resolve the fully qualified domain name (FQDN) of the remote host.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2004/02/11, Modified: 2017/04/14

### Plugin Output

tcp/0

34.105.209.55 resolves as 55.209.105.34.bc.googleusercontent.com.

## 24260 - HyperText Transfer Protocol (HTTP) Information

### Synopsis

Some information about the remote HTTP configuration can be extracted.

### Description

This test gives some information about the remote HTTP protocol - the version used, whether HTTP Keep-Alive and HTTP pipelining are enabled, etc...

This test is informational only and does not denote any security problem.

### Solution

n/a

### Risk Factor

None

## 117886 - Local Checks Not Enabled (info)

### Synopsis

Local checks were not enabled.

### Description

Nessus did not enable local checks on the remote host. This does not necessarily indicate a problem with the scan. Credentials may not have been provided, local checks may not be available for the target, the target may not have been identified, or another issue may have occurred that prevented local checks from being enabled. See plugin output for details.

This plugin reports informational findings related to local checks not being enabled. For failure information, see plugin 21745 :

'Authentication Failure - Local Checks Not Run'.

  Message     :
  Credentials were not provided for detected SSH service.
```

**Synopsis**

---

It is possible to determine which TCP ports are open.

**Description**

---

This plugin is a SYN 'half-open' port scanner. It shall be reasonably quick even against a firewalled target.

Note that SYN scans are less intrusive than TCP (full connect) scans against broken services, but they might cause problems for less robust firewalls and also leave unclosed connections on the remote target, if the network is loaded.

**Solution**

---

Protect your target with an IP filter.

## 19506 - Nessus Scan Information

### Synopsis

This plugin displays information about the Nessus scan.

### Description

This plugin displays, for each tested host, information about the scan itself :

- The version of the plugin set.
- The type of scanner (Nessus or Nessus Home).
- The version of the Nessus Engine.
- The port scanner(s) used.
- The port range scanned.
- The ping round trip time
- Whether credentialed or third-party patch management checks are possible.
- Whether the display of superseded patches is enabled
- The date of the scan.
- The duration of the scan.
- The number of hosts scanned in parallel.
- The number of checks done in parallel.

tcp/0

```
Remote operating system : Linux Kernel 2.6
Confidence level : 65
Method : SinFP
```

```
The remote host is running Linux Kernel 2.6
```

### Synopsis

An SSH server is listening on this port.

### Description

This script detects which algorithms and languages are supported by the remote service for encrypting communications.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2013/10/28, Modified: 2017/08/28

### Plugin Output

tcp/22/ssh

```
Nessus negotiated the following encryption algorithm with the server :
```

```
The server supports the following options for kex_algorithms :
```

```
curve25519-sha256
curve25519-sha256@libssh.org
diffie-hellman-group-exchange-sha256
diffie-hellman-group14-sha1
diffie-hellman-group14-sha256
diffie-hellman-group16-sha512
diffie-hellman-group18-sha512
ecdh-sha2-nistp256
ecdh-sha2-nistp384
ecdh-sha2-nistp521
```

```
The server supports the following options for server_host_key_algorithms :
```

```
ecdsa-sha2-nistp256
rsa-sha2-256
rsa-sha2-512
ssh-ed25519
ssh-rsa
```

```
The server supports the following options for encryption_algorithms_client_to_server :
```

```
aes128-ctr
aes128-gcm@openssh.com
aes192-ctr
aes256-ctr
```

```
aes256-gcm@openssh.com  
chacha20-poly1305@openssh.com
```

The server supports the following options for encryption\_algorithms\_server\_to\_client :

```
aes128-ctr  
aes128-gcm@openssh.com  
aes192-ctr  
aes256-ctr

zlib@openssh.com
```

## 10881 - SSH Protocol Versions Supported

### Synopsis

A SSH server is running on the remote host.

### Description

This plugin determines the versions of the SSH protocol supported by the remote SSH daemon.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2002/03/06, Modified: 2021/01/19

### Plugin Output

tcp/22/ssh

The remote SSH daemon supports the following versions of the SSH protocol :

- 1.99
- 2.0

## 10267 - SSH Server Type and Version Information

### Synopsis

An SSH server is listening on this port.

### Description

It is possible to obtain information about the remote SSH server by sending an empty authentication request.

### Solution

n/a

### Risk Factor

None

### References

XREF IAVT:0001-T-0933

### Plugin Information

Published: 1999/10/12, Modified: 2020/09/22

### Plugin Output

tcp/22/ssh

```
SSH version : SSH-2.0-OpenSSH_7.4p1 Debian-10+deb9u7
SSH supported authentication : publickey
```

## 56984 - SSL / TLS Versions Supported

### Synopsis

The remote service encrypts communications.

### Description

This plugin detects which SSL and TLS versions are supported by the remote service for encrypting communications.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2011/12/01, Modified: 2021/02/03

### Plugin Output

tcp/443/www

This port supports TLSv1.2.

## 83298 - SSL Certificate Chain Contains Certificates Expiring Soon

### Synopsis

The remote host has an SSL certificate chain with one or more certificates that are going to expire soon.

### Description

The remote host has an SSL certificate chain with one or more SSL certificates that are going to expire soon. Failure to renew these certificates before the expiration date may result in denial of service for users.

### Solution

Renew any soon to expire SSL certificates.

### Risk Factor

None

### Plugin Information

Published: 2015/05/08, Modified: 2015/05/08

### Plugin Output

tcp/443/www

The following soon to expire certificate was part of the certificate chain sent by the remote host :

```
| -Subject      : CN=everynoise.com  
| -Not After : Jul 16 21:47:41 2021 GMT
```

## 42981 - SSL Certificate Expiry - Future Expiry

### Synopsis

The SSL certificate associated with the remote service will expire soon.

### Description

The SSL certificate associated with the remote service will expire soon.

### Solution

Purchase or generate a new SSL certificate in the near future to replace the existing one.

### Risk Factor

None

### Plugin Information

Published: 2009/12/02, Modified: 2020/09/04

### Plugin Output

tcp/443/www

The SSL certificate will expire within 60 days, at  
Jul 16 21:47:41 2021 GMT :

Subject	:	CN=everynoise.com
Issuer	:	C=US, O=Let's Encrypt, CN=R3
Not valid before	:	Apr 17 21:47:41 2021 GMT
Not valid after	:	Jul 16 21:47:41 2021 GMT

## 10863 - SSL Certificate Information

### Synopsis

This plugin displays the SSL certificate.

### Description

This plugin connects to every SSL-related port and attempts to extract and dump the X.509 certificate.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2008/05/19, Modified: 2021/02/03

### Plugin Output

tcp/443/www

## 21643 - SSL Cipher Suites Supported

### Synopsis

The remote service encrypts communications using SSL.

### Description

This plugin detects which SSL ciphers are supported by the remote service for encrypting communications.

### See Also

<https://www.openssl.org/docs/man1.1.0/apps/ciphers.html>

<http://www.nessus.org/u?3a040ada>

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2006/06/05, Modified: 2021/03/09

### Plugin Output

tcp/443/www

Here is the list of SSL ciphers supported by the remote server :  
Each group is reported per SSL Version.

SSL Version : TLSv12

High Strength Ciphers (>= 112-bit key)

Name	Code	KEX	Auth	Encryption	MA C
DHE-RSA-AES128-SHA256 SHA256	0x00, 0x9E	DH	RSA	AES-GCM(128)	---
DHE-RSA-AES256-SHA384 SHA384	0x00, 0x9F	DH	RSA	AES-GCM(256)	
ECDHE-RSA-AES128-SHA256 SHA256	0xC0, 0x2F	ECDH	RSA	AES-GCM(128)	
ECDHE-RSA-AES256-SHA384 SHA384	0xC0, 0x30	ECDH	RSA	AES-GCM(256)	

The fields above are :

{Tenable ciphername}  
{Cipher ID code}  
Kex={key exchange}  
Auth={authentication}

Encrypt={symmetric encryption method}  
MAC={message authentication code}  
{export flag}

## 57041 - SSL Perfect Forward Secrecy Cipher Suites Supported

### Synopsis

The remote service supports the use of SSL Perfect Forward Secrecy ciphers, which maintain confidentiality even if the key is stolen.

### Description

The remote host supports the use of SSL ciphers that offer Perfect Forward Secrecy (PFS) encryption. These cipher suites ensure that recorded SSL traffic cannot be broken at a future date if the server's private key is compromised.

### See Also

### Plugin Output

tcp/443/www

Here is the list of SSL PFS ciphers supported by the remote server :

High Strength Ciphers (>= 112-bit key)

Name	Code	KEX	Auth	Encryption	MA C
DHE-RSA-AES128-SHA256 SHA256	0x00, 0x9E	DH	RSA	AES-GCM(128)	---
DHE-RSA-AES256-SHA384 SHA384	0x00, 0x9F	DH	RSA	AES-GCM(256)	---
ECDHE-RSA-AES128-SHA256 SHA256	0xC0, 0x2F	ECDH	RSA	AES-GCM(128)	---
ECDHE-RSA-AES256-SHA384 SHA384	0xC0, 0x30	ECDH	RSA	AES-GCM(256)	---

The fields above are :

```
{Tenable ciphername}  
{Cipher ID code}  
Kex={key exchange}  
Auth={authentication}  
Encrypt={symmetric encryption method}  
MAC={message authentication code}  
{export flag}
```

## 94761 - SSL Root Certification Authority Certificate Information

### Synopsis

A root Certification Authority certificate was found at the top of the certificate chain.

### Description

The remote service uses an SSL certificate chain that contains a self-signed root Certification Authority certificate at the top of the chain.

### See Also

[https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2003/cc778623\(v=ws.10\)](https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2003/cc778623(v=ws.10))

### Solution

Ensure that use of this root Certification Authority certificate complies with your organization's acceptable use and security policies.

### Risk Factor

None

### Plugin Information

Published: 2016/11/14, Modified: 2018/11/15

### Plugin Output

tcp/443/www

The following root Certification Authority certificate was found :

-Subject	:	O=Digital Signature Trust Co./CN=DST Root CA X3
-Issuer	:	O=Digital Signature Trust Co./CN=DST Root CA X3
-Valid From	:	Sep 30 21:12:19 2000 GMT
-Valid To	:	Sep 30 14:01:15 2021 GMT
-Signature Algorithm :		SHA-1 With RSA Encryption

## 51891 - SSL Session Resume Supported

### Synopsis

The remote host allows resuming SSL sessions.

### Description

This script detects whether a host allows resuming SSL sessions by performing a full SSL handshake to receive a session ID, and then reconnecting with the previously used session ID. If the server accepts the session ID in the second connection, the server maintains a cache of sessions that can be resumed.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2011/02/07, Modified: 2020/08/17

### Plugin Output

tcp/443/www

This port supports resuming TLSv1 sessions.

## 22964 - Service Detection

### Synopsis

The remote service could be identified.

### Description

Nessus was able to identify the remote service by its banner or by looking at the error message it sends when it receives an HTTP request.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2007/08/19, Modified: 2021/04/14

### Plugin Output

tcp/22/ssh

An SSH server is running on this port.

## 22964 - Service Detection

### Synopsis

The remote service could be identified.

### Description

Nessus was able to identify the remote service by its banner or by looking at the error message it sends when it receives an HTTP request.

### Solution

n/a

### Risk Factor

A web server is running on this port.

## 22964 - Service Detection

### Synopsis

The remote service could be identified.

### Description

Nessus was able to identify the remote service by its banner or by looking at the error message it sends when it receives an HTTP request.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2007/08/19, Modified: 2021/04/14

### Plugin Output

tcp/443/www

A TLSv1.2 server answered on this port.

tcp/443/www

A web server is running on this port through TLSv1.2.

## 25220 - TCP/IP Timestamps Supported

### Synopsis

The remote service implements TCP timestamps.

### Description

The remote host implements TCP timestamps, as defined by RFC1323. A side effect of this feature is that the uptime of the remote host can sometimes be computed.

### See Also

<http://www.ietf.org/rfc/rfc1323.txt>

### Plugin Output

tcp/0

## 84821 - TLS ALPN Supported Protocol Enumeration

### Synopsis

The remote host supports the TLS ALPN extension.

### Description

The remote host supports the TLS ALPN extension. This plugin enumerates the protocols the extension supports.

### See Also

<https://tools.ietf.org/html/rfc7301>

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2015/07/17, Modified: 2021/02/03

### Plugin Output

tcp/443/www

http/1.1

## 136318 - TLS Version 1.2 Protocol Detection

### Synopsis

The remote service encrypts traffic using a version of TLS.

### Description

The remote service accepts connections encrypted using TLS 1.2.

### See Also

<https://tools.ietf.org/html/rfc5246>

### Solution

N/A

### Risk Factor

None

### Plugin Information

Published: 2020/05/04, Modified: 2020/05/04

### Plugin Output

tcp/443/www

TLSv1.2 is enabled and the server supports at least one cipher.

## 110723 - Target Credential Status by Authentication Protocol - No Credentials Provided

### Synopsis

Nessus was able to find common ports used for local checks, however, no credentials were provided in the scan policy.

### Description

Nessus was not able to successfully authenticate directly to the remote target on an available authentication protocol. Nessus was able to connect to the remote port and identify that the service running on the port supports an authentication protocol, but Nessus failed to authenticate to the remote service using the provided credentials. There may have been a protocol failure that prevented authentication from being attempted or all of the provided credentials for the authentication protocol may be invalid. See plugin output for error details.

Please note the following :

- This plugin reports per protocol, so it is possible for valid credentials to be provided for one protocol and not another. For example, authentication may succeed via SSH but fail via SMB, while no credentials were provided for an available SNMP service.
- Providing valid credentials for all available authentication protocols may improve scan coverage, but the value of successful authentication for a given protocol may vary from target to target depending upon what data (if any) is gathered from the target via that protocol. For example, successful authentication via SSH is more valuable for Linux targets than for Windows targets, and likewise successful authentication via SMB is more valuable for Windows targets than for Linux targets.

### Solution

n/a

### Risk Factor

None

### References

XREF IAVB:0001-B-0504

### Plugin Information

Published: 2018/06/27, Modified: 2021/01/25

### Plugin Output

tcp/0

SSH was detected on port 22 but no credentials were provided.  
SSH local checks were not enabled.

## 10287 - Traceroute Information

### Synopsis

It was possible to obtain traceroute information.

### Description

Makes a traceroute to the remote host.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 1999/11/27, Modified: 2020/08/20

### Plugin Output

34.105.209.55

Hop Count: 20

## 95631 - SSL Certificate Signed Using Weak Hashing Algorithm (Known CA)

### Synopsis

A known CA SSL certificate in the certificate chain has been signed using a weak hashing algorithm.

### Description

The remote service uses a known CA certificate in the SSL certificate chain that has been signed using a cryptographically weak hashing algorithm (e.g., MD2, MD4, MD5, or SHA1). These signature algorithms are known to be vulnerable to collision attacks. An attacker can exploit this to generate another certificate with the same digital signature, allowing the attacker to masquerade as the affected service.

Note that this plugin reports all SSL certificate chains signed with SHA-1 that expire after January 1, 2017 as vulnerable. This is in accordance with Google's gradual sunsetting of the SHA-1 cryptographic hash algorithm.

### See Also

<https://tools.ietf.org/html/rfc3279>

<https://docs.microsoft.com/en-us/security-updates/SecurityAdvisories/2008/961509>

### Solution

Contact the Certificate Authority to have the certificate reissued.

### Risk Factor

None

## Vulnerabilities

A vulnerability is a flaw in a system that may be used to perform illegal operations or acquire access during a cyber assault. When such a flaw is exploited, the system's security is compromised, putting the CIA's triad at risk.

The CIA triad includes:

- Confidentiality – Privilege information is presented to only those who can has clearance
- Integrity – Protects data from being unauthorizedly modified
- Availability – ensuring that data is available to customer when they need it

In order to compromise one's system's security, attackers must first do harm to the CIA triad's exterior. Such attacks include phishing or wiretapping to compromise confidentiality, DoS/DDoS attacks to compromise availability, and man-in-the-middle attacks to compromise the system's integrity.

Such assaults are launched by exploiting a weakness in the system itself. As a result, such flaws must be identified and patched as part of a periodic security audit.

All of the chosen subdomains were examined for vulnerabilities using nikto.

## **www.spotify.com:**

+ GET The anti-clickjacking X-Frame-Options header is not present.

## Impact

Clickjacking is when an attacker uses multiple transparent or opaque layers to trick a user into clicking on a button or link on a framed page when they were intending to click on the top level page. Thus, the attacker is "hijacking" clicks meant for their page and routing them to other another page, most likely owned by another application, domain, or both.

Using a similar technique, keystrokes can also be hijacked. With a carefully crafted combination of stylesheets, iframes, and text boxes, a user can be led to believe they are typing in the password to their email or bank account, but are instead typing into an invisible frame controlled by the attacker.

## Remediation

- Sending the proper X-Frame-Options in HTTP response headers that instruct the browser to not allow framing from other domains.
  - X-Frame-Options: DENY It completely denies to be loaded in frame/iframe.
  - X-Frame-Options: SAMEORIGIN It allows only if the site which wants to load has a same origin.
  - X-Frame-Options: ALLOW-FROM *URL* It grants a specific URL to load itself in a iframe. However please pay attention to that, not all browsers support this.
- Employing defensive code in the UI to ensure that the current frame is the most top level window.

## Classifications

CAPEC-103, CWE-693, ISO27001-A.14.2.5, OWASP 2013-A5, OWASP 2017-A6

+ GET The X-XSS-Protection header is not defined. This header can hint to the user agent to protect against some forms of XSS

## Impact

This issue is reported as additional information only. There is no direct impact arising from this issue.

## Remediation

Add the X-XSS-Protection header with a value of "1; mode=block".

- X-XSS-Protection: 1; mode=block

## Classifications

CWE-16, HIPAA-16, ISO27001-A.14.2.5, WASC-15

## + GET Cookie sp\_t created without the httponly flag

### **Impact:**

If the HttpOnly attribute is set on a cookie, then the cookie's value cannot be read or set by client-side JavaScript. This measure makes certain client-side attacks, such as cross-site scripting, slightly harder to exploit by preventing them from trivially capturing the cookie's value via an injected script.

### **Remediation:**

There is usually no good reason not to set the HttpOnly flag on all cookies. Unless you specifically require legitimate client-side scripts within your application to read or set a cookie's value, you should set the HttpOnly flag by including this attribute within the relevant Set-cookie directive.

You should be aware that the restrictions imposed by the HttpOnly flag can potentially be circumvented in some circumstances, and that numerous other serious attacks can be delivered by client-side script injection, aside from simple cookie stealing.

- + GET Server leaks inodes via ETags, header found with file /robots.txt, fields: 0x196 0x5c32507f11680
- + GET "robots.txt" contains 10 entries which should be manually viewed.

## Impact

Depending on the content of the file, an attacker might discover hidden directories and files.

## Remediation

Ensure you have nothing sensitive exposed within this file, such as the path of an administration panel. If disallowed paths are sensitive and you want to keep it from unauthorized access, do not write them in the Robots.txt, and ensure they are correctly protected by means of authentication.

Robots.txt is only used to instruct search robots which resources should be indexed and which ones are not.

The following block can be used to tell the crawler to index files under /web/ and **ignore the rest**:

```
User-Agent: *
Allow: /web/
Disallow: /
```

Please note that when you use the instructions above, **search engines will not index your website** except for the specified directories.

If you want to hide certain section of the website from the search engines X-Robots-Tag can be set in the response header to tell crawlers whether the file should be indexed or not:

```
X-Robots-Tag: googlebot:nofollow
X-Robots-Tag: otherbot: noindex, nofollow
```

By using X-Robots-Tag you don't have to list the these files in your Robots.txt.

It is also not possible to prevent media files from being indexed by putting using Robots Meta Tags. X-Robots-Tag resolves this issue as well.

For Apache, the following snippet can be put into httpd.conf or an .htaccess file to restrict crawlers to index multimedia files without exposing them in Robots.txt

```
<Files ~ "\.pdf$">
# Don't index PDF files.
Header set X-Robots-Tag "noindex,nofollow"
</Files>
<Files ~ "\.(png|jpe?g|gif)$">
#Don't index image files.
Header set X-Robots-Tag "noindex"
</Files>
```

## **Classifications**

ISO27001-A.18.1.3, OWASP PC-C7

+ GET Uncommon header 'referrer-policy' found, with contents: no-referrer

### Impact

Referer header is a request header that indicates the site which the traffic originated from. If there is no adequate prevention in place, the URL itself, and even sensitive information contained in the URL will be leaked to the cross-site.

The lack of Referrer-Policy header might affect privacy of the users and site's itself

### Actions To Take

In a response header:

Referrer-Policy: no-referrer | same-origin | origin | strict-origin | no-origin-when-downgrading

In a META tag

```
<meta name="Referrer-Policy" value="no-referrer | same-origin"/>
```

In an element attribute

```
<a href="http://crosssite.example.com" rel="noreferrer"></a>
```

or

```
<a href="http://crosssite.example.com" referrerpolicy="no-referrer | same-origin | origin | strict-origin | no-origin-when-downgrading"></a>
```

### Remediation

Please implement a Referrer-Policy by using the Referrer-Policy response header or by declaring it in the meta tags. It's also possible to control referrer information over an HTML-element by using the rel attribute.

## Classifications

CWE-200, ISO27001-A.14.2.5, OWASP 2013-A6, OWASP 2017-A3

+ GET The Content-Encoding header is set to "deflate" this may mean that the server is vulnerable to the BREACH attack.

## Impact

Even if you use an SSL/TLS protected connection, an attacker can still view the victim's encrypted traffic and cause the victim to send HTTP requests to the vulnerable web server (by using invisible frames). Following these steps, an attacker could steal information from the website and do the following:

- Inject partial plaintext they have uncovered into a victim's requests
- Measure the size of encrypted traffic

## Remediation

Reported a Possible BREACH Attack issue because the target web page meets the following conditions that facilitate it:

- Served from a server that uses HTTP-level compression (ie. gzip)
- Reflects user-input in the HTTP response bodies
- Contains sensitive information (such as a CSRF token) in HTTP response bodies

To mitigate the issue, we recommend the following solutions:

1. If possible, disable HTTP level compression
2. Separate sensitive information from user input
3. Protect vulnerable pages with CSRF token. The SameSite Cookie attribute will mitigate this issue, because to exploit this issue an attacker forces the victim to visit a target website using invisible frames. With the SameSite cookie attribute

- added, cookies that belong to the target won't be sent with a request that does not include top level navigation.
4. Hide the length of the traffic by adding a random number of bytes to the responses.
  5. Add in a rate limit, so that the page maximum is reached five times per minute.

### **Classifications**

CWE-310, OWASP 2013-A9, OWASP 2017-A9 ,  
CVSS:3.0/AV:N/AC:L/PR:N/UI:R/S:U/C:H/I:N/A:N

<a href="http://crosssite.example.com" referrerpolicy="no-referrer | same-origin | origin | strict-origin | no-origin-when-downgrading"></a>
```

## Remediation

Please implement a Referrer-Policy by using the Referrer-Policy response header or by declaring it in the meta tags. It's also possible to control referrer information over an HTML-element by using the rel attribute.

## + GET The site uses SSL and the Strict-Transport-Security HTTP header is not defined.

### impact

HTTP Strict Transport Security (HSTS) is an opt-in security enhancement that is specified by a web application through the use of a special response header.

Once a supported browser receives this header that browser will prevent any communications from being sent over HTTP to the specified domain and will instead send all communications over HTTPS. It also prevents HTTPS click through prompts on browsers

## Remediation

Set the Strict-Transport-Security: max-age=31536000;  
includeSubDomains

For IIS:

Install HTTP Strict Transport Security IIS Module.

<http://htsiiis.codeplex.com/>

**+ GET The X-Content-Type-Options header is not set. This could allow the user agent to render the content of the site in a different fashion to the MIME type**

## Impact

MIME type sniffing is a standard functionality in browsers to find an appropriate way to render data where the HTTP headers sent by the server are either inconclusive or missing.

This allows older versions of Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the response body to be interpreted and displayed as a content type other than the intended content type.

The problem arises once a website allows users to upload content which is then published on the web server. If an attacker can carry out XSS (Cross-site Scripting) attack by manipulating the content in a way to be accepted by the web application and rendered as HTML by the browser, it is possible to inject code in e.g. an image file and make the victim execute it by viewing the image.

## Remediation

1. When serving resources, make sure you send the content-type header to appropriately match the type of the resource being served. For example, if you are serving an HTML page, you should send the HTTP header:

Content-Type: text/html

2. Add the X-Content-Type-Options header with a value of "nosniff" to inform the browser to trust what the site has sent is the appropriate content-type, and to not attempt "sniffing" the real content-type.

X-Content-Type-Options: nosniff

## Classifications

CWE-16, ISO27001-A.14.1.2, WASC-15, OWASP 2013-A5, OWASP 2017-A6

## **everynoise.com:**

**+ The anti-clickjacking X-Frame-Options header is not present.**

### **Impact**

Clickjacking is when an attacker uses multiple transparent or opaque layers to trick a user into clicking on a button or link on a framed page when they were intending to click on the top level page. Thus, the attacker is "hijacking" clicks meant for their page and routing them to other another page, most likely owned by another application, domain, or both.

Using a similar technique, keystrokes can also be hijacked. With a carefully crafted combination of stylesheets, iframes, and text boxes, a user can be led to believe they are typing in the password to their email or bank account, but are instead typing into an invisible frame controlled by the attacker.

### **Remediation**

- Sending the proper X-Frame-Options in HTTP response headers that instruct the browser to not allow framing from other domains.
  - X-Frame-Options: DENY It completely denies to be loaded in frame/iframe.
  - X-Frame-Options: SAMEORIGIN It allows only if the site which wants to load has a same origin.
  - X-Frame-Options: ALLOW-FROM *URL* It grants a specific URL to load itself in a iframe. However please pay attention to that, not all browsers support this.
- Employing defensive code in the UI to ensure that the current frame is the most top level window.

### **Classifications**

CAPEC-103, CWE-693, ISO27001-A.14.2.5, OWASP 2013-A5,  
OWASP 2017-A6

**+ The X-XSS-Protection header is not defined. This header can hint to the user agent to protect against some forms of XSS**

## **Impact**

This issue is reported as additional information only. There is no direct impact arising from this issue.

## **Remediation**

Add the X-XSS-Protection header with a value of "1; mode=block".

- X-XSS-Protection: 1; mode=block

## **Classifications**

CWE-16, HIPAA-16, ISO27001-A.14.2.5, WASC-15

**+ The site uses SSL and the Strict-Transport-Security HTTP header is not defined.**

## **impact**

HTTP Strict Transport Security (HSTS) is an opt-in security enhancement that is specified by a web application through the use of a special response header.

Once a supported browser receives this header that browser will prevent any communications from being sent over HTTP to the specified domain and will instead send all communications over HTTPS. It also prevents HTTPS click through prompts on browsers

## Remediation

Set the Strict-Transport-Security: max-age=31536000;  
includeSubDomains

For IIS:

Install HTTP Strict Transport Security IIS Module.

<http://htsiiis.codeplex.com/>

**+ The X-Content-Type-Options header is not set. This could allow the user agent to render the content of the site in a different fashion to the MIME type**

## Impact

MIME type sniffing is a standard functionality in browsers to find an appropriate way to render data where the HTTP headers sent by the server are either inconclusive or missing.

This allows older versions of Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the response body to be interpreted and displayed as a content type other than the intended content type.

The problem arises once a website allows users to upload content which is then published on the web server. If an attacker can carry out XSS (Cross-site Scripting) attack by manipulating the content in a way to be accepted by the web application and rendered as HTML by the browser, it is possible to inject code in e.g. an image file and make the victim execute it by viewing the image.

## Remediation

1. When serving resources, make sure you send the content-type header to appropriately match the type of the resource being served. For example, if you are serving an HTML page, you should send the HTTP header:

Content-Type: text/html

2. Add the X-Content-Type-Options header with a value of "nosniff" to inform the browser to trust what the site has sent is the appropriate content-type, and to not attempt "sniffing" the real content-type.

X-Content-Type-Options: nosniff

## Classifications

CWE-16, ISO27001-A.14.1.2, WASC-15, OWASP 2013-A5, OWASP 2017-A6

**+ The Content-Encoding header is set to "deflate" this may mean that the server is vulnerable to the BREACH attack.**

## Impact

Even if you use an SSL/TLS protected connection, an attacker can still view the victim's encrypted traffic and cause the victim to send HTTP requests to the vulnerable web server (by using invisible frames). Following these steps, an attacker could steal information from the website and do the following:

- Inject partial plaintext they have uncovered into a victim's requests
- Measure the size of encrypted traffic

## Remediation

Reported a Possible BREACH Attack issue because the target web page meets the following conditions that facilitate it:

- Served from a server that uses HTTP-level compression (ie. gzip)
- Reflects user-input in the HTTP response bodies
- Contains sensitive information (such as a CSRF token) in HTTP response bodies

To mitigate the issue, we recommend the following solutions:

6. If possible, disable HTTP level compression
7. Separate sensitive information from user input
8. Protect vulnerable pages with CSRF token. The SameSite Cookie attribute will mitigate this issue, because to exploit this issue an attacker forces the victim to visit a target website using invisible frames. With the SameSite cookie attribute added, cookies that belong to the target won't be sent with a request that does not include top level navigation.
9. Hide the length of the traffic by adding a random number of bytes to the responses.

10.Add in a rate limit, so that the page maximum is reached five times per minute.

### Classifications

CWE-310, OWASP 2013-A9, OWASP 2017-A9 ,

## OWASP-ZAP

## OWASP TOP 10 Vulnerabilities

- • Injection
- • Collapsed Authentication
- • Unstable Data Exposure
- • external entities (XXE)
- • Broken Access Control
- • Security Misconfiguration
- • Cross- Site Scripting (XSS)
- • Insecure Deserialization
- • Using Components with Known Vulnerabilities.
- • Insufficient Logging and Monitoring

Vulnerability	Information
Injection	<p>SQL, NoSQL, OS, and LDAP injection vulnerabilities will target any data source and involve attackers sending malicious data to a recipient. This is a very common threat in legacy code, and it can lead to data loss, access compromise, and corruption.</p> <p>For ultimately reduce this risks we can use a safe database API, a database abstraction layer, or a parameterized database interface.</p> <p>Type of injections: -</p>

	<ul style="list-style-type: none"> <li>• Cross-site scripting(XSS)</li> <li>• SQL injection</li> <li>• Code injection</li> <li>• Email-header injection</li> <li>• OS command injection</li> </ul>
Collapsed Authentication	<p>Attackers will steal passwords, keys, and impersonate user identities if authentication is done incorrectly. Because of improperly enforced identity and access controls, this happens all the time.</p> <p>To avoid this problem, multi-factor authentication and weak password checks are a great starting point.</p>
	<p>To prevent this risks, we can avoid from enforcing composition rules on passwords.</p> <p>Types of collapsed authentication attacks: -</p> <ul style="list-style-type: none"> <li>• Un- hashed passwords</li> <li>• Credential stuffing</li> <li>• Misconfigured session timeout</li> <li>• Exploiting the cookies</li> </ul>
Unstable data exposure	<p>If application or API's are not protecting properly, personal data can be hijacked or modified for use to fraud, identity theft or another criminal activity.</p> <p>Proper controls, encryption, removal of unnecessary data, strong authentication can prevent this vulnerability.</p>
External Entities	<p>External entities may be used to distribute internal files or to carry out internal port scanning, remote code execution, and DDoS attacks. Although determining and eliminating XXE vulnerabilities can be difficult.</p> <p>By patching all XML processors, ensuring comprehensive validation of XML input according to a schema, limiting XML input</p>

	<p>where possible can prevent this risk.</p> <p>This may lead to: -</p> <ul style="list-style-type: none"> <li>• Identity theft</li> <li>• Denial of service attacks</li> <li>• Disclosure of sensitive data</li> </ul>
Broken access control	<p>When regulations regarding user access are not properly implemented, access control is broken. As a result, attackers take advantage of bugs to gain access to data and functionality that they would not otherwise have access to. Such as,</p> <ul style="list-style-type: none"> <li>• accessing other user's accounts</li> <li>• viewing sensitive files</li> <li>• modifying other user's data</li> <li>• changing access rights.</li> </ul> <p>To prevent this risk, it's better to use an API gateway.</p>
Security misconfiguration	<p>These are the most frequent and typical web security threats.</p> <ul style="list-style-type: none"> <li>• Insecure or incomplete configurations.</li> <li>• Open cloud storage</li> <li>• Verbose error messages</li> </ul> <p>Are reasons for these misconfigurations.</p>
	<p>It is better to securely configure and patch all operating systems, frameworks, libraries, and applications to prevent misconfigurations.</p>
Cross-site scripting(XSS)	<p>This happens when an application includes untrusted data in web pages. Using XSS flaws, attackers can execute scripts in the victim's browser. This is caused by</p>

	<p>hijacked user sessions, defaced websites, or redirecting the user to the malicious site.</p> <p>Organizations should separate the data from a running browser content to prevent XSS.</p> <p>EX: - use libraries that automatically bypass user input.</p> <p>Types of XSS attacks: -</p> <ul style="list-style-type: none"> <li>• Reflected XSS</li> <li>• Stored XSS</li> <li>• DOM-based XSS</li> </ul>
Insecure deserialization	<p>This can often lead to distant code execution scenarios. When remote code execution doesn't happen, this flaw can be caused for replay, injection and advanced escalation attacks.</p>
	<p>By denying calibrated objects from untrusted sources can prevent this risk.</p>
Using components with known vulnerabilities	<p>Applications and APIs that use components with known vulnerabilities can destroy application security and open up a variety of attacks.</p> <p>Strong patch management measures can prevent this threat.</p>
Insufficient logging and monitoring	<p>This vulnerability enables attackers to go unnoticed within an organization and destroy important data. This leads attackers to have access to the system for a long time period.</p> <p>Using an effective monitoring and incident alerting solution can prevent this problem.</p>

# Risk level classification

Low	The low-risk level denotes the lowest level of danger associated with a particular weakness. This will contribute to the application of information about the web application that would not otherwise be available.
Medium	The medium risk level denotes a high level of risk in conjunction with a particular vulnerability. An attacker can obtain low-level knowledge about the application by exploiting a medium vulnerability. After the high-risk vulnerabilities have been addressed, the medium-risk vulnerabilities should be addressed.
High	The high-risk level denotes the greatest danger posed by a particular weakness. An attacker can successfully manipulate the target application and partially or completely compromise the application data. An attacker may cause the web application's data to be modified or deleted.
Extremely High	The transition attempt is almost certainly destined to fail, with disastrous consequences.

## Alert Detail

Medium (Medium)	Application Error Disclosure
Description	This page contains an error/warning message that may disclose sensitive information like the location of the file that produced the unhandled exception. This information can be used to launch further attacks against the web application. The alert could be a false positive if the error message is found inside a documentation page.
URL	<a href="https://www.spotify.com/privacy/static/_next/static/chunks/pages/_app-1064a82fcbe2eb8194ac.js">https://www.spotify.com/privacy/static/_next/static/chunks/pages/_app-1064a82fcbe2eb8194ac.js</a>
Method	GET
Evidence	Type mismatch
Instances	1
Solution	Review the source code of this page. Implement custom error pages. Consider implementing a mechanism to provide a unique error reference/identifier to the client (browser) while logging the details on the server side and not exposing them to the user.

Solution	Most modern Web browsers support the X-Frame-Options HTTP header. Ensure it's set on all web pages returned by your site (if you expect the page to be framed only by pages on your server (e.g. it's part of a FRAMESET) then you'll want to use SAMEORIGIN, otherwise if you never expect the page to be framed, you should use DENY). Alternatively consider implementing Content Security Policy's "frame-ancestors" directive.

Source ID	3
Low (Medium)	Absence of Anti-CSRF Tokens

Description	<p>No Anti-CSRF tokens were found in a HTML submission form.</p> <p>A cross-site request forgery is an attack that involves forcing a victim to send an HTTP request to a target destination without their knowledge or intent in order to perform an action as the victim. The underlying cause is application functionality using predictable URL/form actions in a repeatable way. The nature of the attack is that CSRF exploits the trust that a web site has for a user. By contrast, cross-site scripting (XSS) exploits the trust that a user has for a web site. Like XSS, CSRF attacks are not necessarily cross-site, but they can be. Cross-site request forgery is also known as CSRF, XSRF, one-click attack, session riding, confused deputy, and sea surf.</p> <p>CSRF attacks are effective in a number of situations, including:</p> <ul style="list-style-type: none"> <li>* The victim has an active session on the target site.</li> <li>* The victim is authenticated via HTTP auth on the target site.</li> <li>* The victim is on the same local network as the target site.</li> </ul> <p>CSRF has primarily been used to perform an action against a target site using the victim's privileges, but recent techniques have been discovered to disclose information by gaining access to the response. The risk of information disclosure is dramatically increased when the target site is vulnerable to XSS, because XSS can be used as a platform for CSRF, allowing the attack to operate within the bounds of the same-origin policy.</p>

Solution	<p>Phase: Architecture and Design      Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.      For example, use anti-CSRF packages such as the OWASP CSRFGuard.</p> <p>Phase: Implementation      Ensure that your application is free of cross-site scripting issues, because most CSRF defenses can be bypassed using attacker-controlled script.</p> <p>Phase: Architecture and Design      Generate a unique nonce for each form, place the nonce into the form, and verify the nonce upon receipt of the form. Be sure that the nonce is not predictable (CWE-330).</p> <p>Note that this can be bypassed using XSS.      Identify especially dangerous operations. When the user performs a dangerous operation, send a separate confirmation request to ensure that the user intended to perform that operation.</p> <p>Note that this can be bypassed using XSS.      Use the ESAPI Session Management control.      This control includes a component for CSRF.      Do not use the GET method for any request that triggers a state change.</p> <p>Phase: Implementation      Check the HTTP Referer header to see if the request originated from an expected page. This could break legitimate functionality, because users or proxies may have disabled sending the Referer for privacy reasons.</p>
Other information	No known Anti-CSRF token [anticsrf, CSRFToken, __RequestVerificationToken, csrfmiddlewaretoken, authenticity_token, OWASP_CSRFTOKEN, anoncsrf, csrf_token, _csrf, _csrfSecret, __csrf_magic, CSRF] was found in the following HTML form: [Form 1: "email" "confirm" "password" "displayname" "year" "day" "gender_option_male" "gender_option_female" "gender_option_nonbinary" "marketing-opt-checkbox" "third-party-checkbox" "terms-conditions-checkbox" "recaptchaV2" ].

Informational (Low)	<b>Loosely Scoped Cookie</b>
Description	Cookies can be scoped by domain or path. This check is only concerned with domain scope. The domain scope applied to a cookie determines which domains can access it. For example, a cookie can be scoped strictly to a subdomain e.g. www.nottrusted.com, or loosely scoped to a parent domain e.g. nottrusted.com. In the latter case, any subdomain of nottrusted.com can access the cookie. Loosely scoped cookies are common in mega-applications like google.com and live.com. Cookies set from a subdomain like app.foo.bar are transmitted only to that domain

	by the browser. However, cookies scoped to a parent-level domain may be transmitted to the parent, or any subdomain of the parent.

## Conclusion

The general security of the program looked to be efficiently planned and performed at the completion of the test, with the exception of a few loose ends. Perfection in a web application is difficult to achieve since one development might lead to another problem. The use of robots.txt should be highlighted in particular since it was well-structured and planned in terms of restricting access to just specific folders. Wildcard is cost-effective; but, if the main domain is broken or compromised, it exposes several subdomains to access. Overall, owing to the employment of security techniques and protocols, the web application's security and integrity are well-structured.

Overall, the audited web application was well-designed and has several security features in place to protect itself from cyber-attacks. There were only medium to low risk vulnerabilities discovered throughout the testing, as well as best practices, and no high-risk vulnerabilities, which is a solid indicator that a website is safe and effectively safeguarded.

However, the website was found to be vulnerable to a couple of the most popular cyber assaults today, including Cross Site Scripting and SQL injections. Amazon is one of the most well-known e-commerce corporations in the world, and the fact that even a well-equipped firm cannot properly defend itself from all types of cyber assaults demonstrates how hard the world of online and cyber security has become in recent years.
